

## ABSTRACT OF THE DISCLOSURE

An index print of photographic images is created on a CD containing digital data representing those images. Photographic images are digitized to produce digital image data which is stored on the CD. This digital image data is also used to create an index print containing thumbnail images of all of the photographs stored on the CD. The index print is then affixed to the top surface of the CD either by being printed on a label that is adhered to the disk surface, or by being printed directly on the surface of the disk.
